AB To investigate the ultrastructural mechanisms of acute microvessel hyperpermeability by vascular endothelial growth factor (VEGF), we combined a mathematical model (J Biomech Eng 116: 502-513, 1994) with experimental data of the effect of VEGF on microvessel hydraulic conductivity (L(p)) and permeability of various-sized solutes. We examined the effect of VEGF on microvessel permeability to a small solute (sodium fluorescein, Stokes radius 0.45 nm), an intermediate solute (alpha-lactalbumin, Stokes radius 2.01 nm), and a large solute [albumin (BSA), Stokes radius 3.5 nm]. Exposure to 1 nM VEGF transiently increased apparent permeability to 2.3, 3.3, and 6.2 times their baseline values for sodium fluorescein, alpha-lactalbumin, and BSA, respectively, within 30 s, and all returned to control within 2 min. On the basis of L(p) (DO Bates and FE Curry. Am J Physiol Heart Circ Physiol 271: H2520-H2528, 1996) and permeability data, the prediction from the model suggested that the most likely structural changes in the interendothelial cleft induced by VEGF would be a approximately 2.5-fold increase in its opening width and partial degradation of the surface glycocalyx.

OTHER SOURCE: WPI: 2003-120668 [11]

AB DERWENT ABSTRACT:

NOVELTY - An isolated human serine threonine kinase member, designated h2520-40 polypeptide (I) comprising 435 residue amino acid sequences (S1), given in specification, or mature sequence, ortholog or fragment of (S1), sequence having 70 % identity to (S1), allelic/splice variant of (S1), or (S1) with substitutions, insertions, deletions, C-terminal or N-terminal truncation, having activity of (I), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) an isolated nucleic acid molecule (II) comprising a 1750 base pair sequence (S2), given in the specification, the h2520-40 encoding portion of (S2) comprising nucleotides 405-1709, a nucleotide sequence encoding (I), allelic variant or splice variant of (S2), fragment of (S2) comprising at least 16 nucleotides, sequence which hybridizes under moderately or highly stringent conditions to the complement of them, or sequence complementary to the sequences; (2) a vector (III) comprising (II); (3) a host cell (IV) comprising (III); (4)

production (M1) of (I); (5) a polypeptide produced by M1; (6) an isolated polypeptide encoded by (II); (7) an antibody (V) or its fragment that specifically binds (I), produced by immunizing an animal with a peptide comprising (S1); (8) a selective binding agent (VI) or its fragment that specifically binds (I), comprising a complementarity determining region with specificity for a polypeptide having (S1), and produced by immunizing an animal with a polypeptide comprising (S1); (9) a hybridoma that produces a monoclonal antibody or (VI) that binds (I); (10) a composition (VII) comprising (I) or (II) and a formulation agent; (11) a polypeptide (VIII) comprising a derivative of (I); (12) a viral vector comprising (II); (13) a fusion polypeptide (IX) comprising (I) fused to a heterologous amino acid sequence; (14) a device comprising a membrane suitable for implantation, and cells encapsulated within the membrane, where the cells secrete (I) and the membrane is permeable to the protein and impermeable to materials detrimental to the cells, or the h2520-40 polypeptide encapsulated within the membrane, where the membrane is permeable to the polypeptide; (15) a transgenic non-human mammal comprising (II); (16) a diagnostic reagent comprising a detectably labeled polynucleotide encoding (S1), or its fragment, allelic or splice variants or homolog; and (17) an antagonist of h2520-40 polypeptide activity selected from h2520-40 selective binding agents, small molecules, antisense oligonucleotides, and peptides or their derivatives having specificity for h2520-40 polypeptide.

WIDER DISCLOSURE - (1) a kit comprising h2520-40 selective binding agents and other reagents useful for detecting h2520-40 levels in biological samples; and (2) kits containing single and multi-chambered pre-filled syringes.

BIOTECHNOLOGY - Preparation: (I) is prepared by culturing a eukaryotic or prokaryotic cell under suitable conditions to express the polypeptide, and optionally isolating the polypeptide from the culture. The nucleic acid molecule comprises promoter DNA other than the promoter DNA for the native h2520-40 polypeptide operatively linked to the DNA encoding the h2520-40 polypeptide. (All claimed.)

Preferred Polypeptide: In (I), the amino acid at position 88 of (S1) is valine, isoleucine, methionine, leucine, phenylalanine, alanine, or norleucine, at position 96 of (S1) threonine or serine, at position 101 of (S1) is alanine, valine, leucine or isoleucine, at position 121 of (S1) is glutamic acid or aspartic acid, at position 130 of (S1) is histamine, asparagine, glutamine, lysine or arginine, at position 133 of (S1) is isoleucine, leucine, valine, methionine, alanine, phenylalanine or norleucine, at position 156 of (S1) is glycine, proline or alanine, at position 183 of (S1) is alanine, valine, leucine or isoleucine, at position 195 of (S1) arginine, lysine, glutamine or asparagine, at position 215 of (S1) is phenylalanine, leucine, valine, isoleucine, alanine, or tyrosine, at position 231 of (S1) is cysteine, serine or alanine, at position 288 of (S1) is tyrosine, tryptophan, phenylalanine, threonine or serine, or at position 295 of (S1) is serine, threonine, alanine or cysteine. (VIII) is covalently modified with a water-soluble polymer such as polyethylene glycol (PEG), monomethoxy-PEG, dextran, cellulose, poly-(N-vinyl pyrrolidone) PEG, propylene glycol homopolymers, polypropylene oxide/ethylene oxide co-polymers, polyoxyethylated polyols, or polyvinyl alcohol. In (IX), the heterologous amino acid sequence is an IgG constant domain or its fragment. Preferred Nucleic Acid: In (II), the percent identity is determined using a computer program such as GAP, BLASTP, BASTN, FASTA, BLASTA, BLASTX, BestFit, and the Smith-Waterman algorithm. Preferred Antibody: (V) is a monoclonal antibody. Preferred Agent: (VI) is an antibody such as humanized antibody, human antibody, polyclonal antibody, monoclonal antibody, chimeric antibody, CDR-grafted antibody, anti-idiotypic antibody, or their fragments or a variable region fragment (e.g. a Fab or Fab' fragment). (VI) is bound to a detectable label, and antagonizes h2520-40 polypeptide biological activity. Preferred Composition: In (VII), the formulation agent is a carrier, adjuvant, solubilizer, stabilizer or anti-oxidant. The nucleic acid molecule is contained in a viral vector. Preferred Reagent: In the

diagnostic reagent, the labeled polynucleotide is a first-strand cDNA.

ACTIVITY - Vulnerary; Antidiabetic; Antipsoriatic; Hepatotropic; Antiinflammatory; Osteopathic; Antiarthritic; Antirheumatic; Cytostatic. No biological data is given.

MECHANISM OF ACTION - Gene therapy; Cell therapy.

USE - (I) is useful for identifying a compound which binds to (I), and treating, preventing or ameliorating a medical condition in a mammal resulting from decreased levels of h2520-40 polypeptide. (I) is also useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject caused by or resulting from abnormal levels of h2520-40 polypeptide, by determining the presence or amount of expression of (I), and comparing the level of h2520-40 polypeptide in a biological, tissue or cellular sample from normal subjects or the subject at an earlier time. (II) is useful for modulating levels of a polypeptide in a mammal. (IV) is useful for identifying candidate inhibitors or stimulators of h2520 polypeptide activity or production, by exposing (IV) to the inhibitors or stimulators, measuring h2520-40 polypeptide activity or production in the cell, and comparing activity or production of h2520-40 in cells exposed to the inhibitor or stimulator with activity in cells not exposed to the inhibitor or stimulator. (V) is useful for detecting or quantitating the amount of h2520-40 in a sample, by detecting the binding of (V) or its fragment to the h2520-40 polypeptide. (VI) is useful for treating, preventing, or ameliorating disease, condition or disorder. (X) is useful for detecting the presence of h2520-40 nucleic acids in a biological (e.g. tissue or cellular) sample, by contacting the biological sample with (X), detecting hybridization of (X) with h2520-40 nucleic acids in the biological sample, and comparing the level of hybridization with the level of hybridization between a known concentration of h2520-40 nucleic acid and (X). The polynucleotide molecule is DNA or RNA. (All claimed.) h2520-40 is useful as a small molecule inhibitor target. (I) is useful for identifying molecules that are agonists or antagonists of h2520-40 polypeptide, identifying receptors or their binding partners and as immunogen for producing antibodies. (II) is useful as hybridization probes to screen cDNA, genomic or synthetic DNA libraries for related sequences, to identify transformed cells, to map the locations of the h2520-40 gene and related genes on chromosomes, as a diagnoses/prognosis marker, and as a surrogate marker to monitor tumor growth and treatment success. The non-human animals are useful for drug candidate screening. (V) is useful for detection and quantitation of h2520-40 polypeptides, and for in vivo imaging. (I), (II) and (V) are useful for treating hyperproliferative pathological conditions such as immune disorders, angiogenesis, vasculogenesis, wound healing, diabetes mellitus including diabetes type I and type II, psoriasis, liver diseases such as hepatitis and cirrhosis, osteoporosis, inflammatory conditions such as osteoarthritis and rheumatoid arthritis, pregnancy and cancer.

ADMINISTRATION - Administered at a dose of 0.1-100 mg/kg, by oral, intravenous, intraperitoneal, intracerebral, intracerebroventricular, intramuscular, intra-ocular, intraarterial, intraportal, or intralesional route. No dosage is given.

EXAMPLE - Cloning of human serine threonine kinase member, designated h2520-40. A search was first performed on the Celera genomic database to identify potential kinases. This search identified an expression sequence tag (EST) sequence, as a putative serine threonine (ser/thr) kinase. Using this sequence, polymerase chain reaction (PCR) primers were designed to screen human cDNA libraries. A 5' forward primer 5'GCCTTGGGGTGCTTTTG3' and 3' reverse primer 5'TTTCTTCTTCCTTGAGAGTGCTGG3' were used to generate a 298 base pair PCR product. Subsequently, a 3' rapid amplification of cDNA ends (RACE) primer 5'CTGAACACTTTCTGTGGGTC3' was designed and used to screen the Marathon-Ready (RTM) Human Ling cDNA kit in order to identify the potential 3' end of the ser/thr kinase gene. The resulting PCR products

were TA cloned into the TA cloning vector pCR2.1 TOPO and transformed into TOPO10 *Escherichia coli*. Positive clones were screened by detecting the presence of a 298 base pair product by PCR. The PCR reaction products were separated electrophoretically and 4 positive wells were scored by the presence of a 298 base pair band. The plasmid DNA was prepared from each of the positive clones and both strands of cDNA were sequenced, identifying the putative 3' end of the ser/thr kinase gene. The 3' sequence was then used to identify the *Caenorhabditis elegans* predicted protein F49C5.4 through a BLAST search. This predicted protein was then used to search the human EST database, which revealed a human EST (R59486) with a high homology with the potential 5' end of the ser/thr kinase gene. The resulting sequence (R59486) was then used to design PCR primer pairs to synthesize a 1300 base pair product. The 5' forward primer (5'TCAAGGGAAATAGCAAACAG3') and 3' reverse primer (5'GGCAGGGCTCTGACACG3') were used to screen the Marathon-Ready (RTM) human hypothalamus cDNA kit using PCR. The resulting PCR products were TA cloned into pCR2.1 TOPO. Nested PCR was then carried out on positive colonies. The PCR reaction products were separated electrophoretically and 4 positive wells were scored by the presence of a 750 base pair band. The plasmid DNA was prepared and both strands of the cDNA insert were sequenced. Sequence homology in the putative kinase domain revealed homology with other members of the ser/thr protein kinase family. For full length cloning of the gene, the 5' forward primer (5'TCAAGGGAAATAGCAAACAG3'), and 3' reverse primer (5'AGCAACAATCATCTTGGTTAGTTAC3') were used to screen the Marathon-Ready (RTM) human hypothalamus cDNA kit using PCR. The resulting PCR products were TA cloned into pCR2.1 TOPO. Nested PCR was then carried out on positive colonies. The PCR reaction products were separated electrophoretically and six positive wells were scored by the presence of a 750 base pair band. The plasmid DNA was prepared and both strands of the cDNA insert were sequenced. The cDNA sequence encoding the putative ser/thr kinase polypeptide, denoted as h2520-40, was determined. The h2520-40 gene was 1750 nucleotides in length with a 1305 nucleotide coding region. This open reading frame encoded a 435 amino acid polypeptide. (74 pages)

 AB Lp is measured using the Landis Michel method, which has previously shown a transient absorption when perfusing with small molecular weight substances such as glucose that exert a transient osmotic pressure across the vessel wall. Here we present evidence for an unusual transient absorption caused by DMSO, a compound often used as a vehicle. Lp was measured in anaesthetised frogs as previously described (Bates et al, AJP 271:H2520). Vessels were perfused with 1% BSA with varying

concentrations of DMSO while measuring L_p . Upon vessel occlusion during DMSO perfusion a transient, decreasing absorption was seen which reversed at 9.8 ± 3.1 s with 0.1% DMSO and 15.1 ± 4.4 s with 1% DMSO. DMSO concentration correlated with the initial absorption rate ($r=0.68$, $p<0.0001$, $n=32$) and initial filtration rate ($r=0.57$, $p<0.001$, $n=30$). After removal of the occlusion flow resumed. Upon repeat of the occlusion a similar transient absorption was again measured which occurred for all subsequent occlusions. We speculate that this transient absorption is an osmotic transient caused by local changes in salt concentration elicited by the effect of DMSO on the cell membrane.

AB To investigate the structural mechanisms of acute microvessel hyperpermeability by VEGF, we need to combine a mathematical model with the experimental data of VEGF effect on microvessel hydraulic permeability (L_p) and various sized solute permeability (P) (Fu et al., METMBS'00 Int. Conf.:89-95, 2000). Exposure to 1 nM VEGF transiently increased L_p within 30 sec (to 7.8-fold of baseline values) and returned to control within 2 min (Bates and Curry, AJP 40: H2520, 1996). The current study is aimed at examining VEGF effect on small solute permeability. The venular capillary in frog mesentery was perfused alternatively via one of two pipettes at an Y junction. One pipette contains a clear perfusate of either 1% BSA frog Ringer for control or 1nM VEGF for test measurements; the other contains the control perfusate to which the fluorescent small solute (sodium fluorescein 0.1 mg/ml; MW 376, Stokes radius 0.45nm) was added. P was determined using the method for microscope photometry (Curry, et al., AJP 245:H495, 1983). The mean control P for 7 tested vessels was $4.5 (+2.2 \text{ SD}) \times 10^{-5}$ cm/s. The response pattern of P to VEGF is shown in the figure (Mean \pm SE). This pattern is similar to that of L_p to VEGF. The peak value of P/P_{control} at approx 30 sec was only measured in 2 vessels, 5.5 and 1.9, respectively. If using the mean of these values, 3.7, for P/P_{control} and 7.8 for L_p/L_p control, the model would predict that the transient increase in microvessel permeability by VEGF is caused by approx 2.5-fold transient increase in the height of the interendothelial cleft.

AB A new structural type of **kinase** inhibitor, containing a
benzocarbazole nucleus, has been identified. Members of the series are
selective for inhibition of the cyclin dependent **kinase** family

of enzymes. Although the cdk's are highly homologous, representatives of the series showed intra-cdk selectivities, especially for cdk4. SAR studies elucidated the important features of the molecules for inhibition.

AB Progression of mammalian cells through the cell cycle is regulated by the coordinated activity of a family of cyclin dependent **kinases** (cdks). Of special interest are the complexes of cdk4 with D-type cyclins and cdk2/cyclin E. Activation of cdk4 results in a specific phosphorylation of the retinoblastoma protein (pRb) which is crit. to the release of transcription factors of the E2F family. The Rb **kinase** pathway is the nexus of biol. control of the entry into the cell cycle and is frequently involved in oncogenic transformation. These factors make specific inhibitors of cdks of high interest for pharmacol. intervention in cancer. We have found a new series of cdk inhibitors that contain an indenopyrazole core. The synthesis and basic SAR of the series will be discussed leading to nM level inhibitors of the cdks. These ATP competitive agents will be profiled against other classes of **kinases**. Aspects of the interaction of the inhibitors with cdk2 will be discussed in the context of a structural model. Effects of these inhibitors on transformed cells will be examd. and discussed in a mechanistic context.

AB Differential phosphorylation of the retinoblastoma protein plays a pivotal role in cell cycle regulation. The retinoblastoma protein is specifically phosphorylated during the cell cycle by cyclin-dependent **kinase** complexes which intersect with many cellular signaling networks. Since the loss of the retinoblastoma signaling pathways occurs in a wide variety of human tumors, understanding the significance of site-specific phosphorylation can clarify the role of selected cyclin-dependent **kinase** complexes during cell cycle progression. Here we describe the phosphospecificity and cellular characterization of a panel of polyclonal antibodies that recognize unique phosphorylation sites within the retinoblastoma protein. These reagents were used to validate authentic cellular retinoblastoma phosphorylation sites at amino acids 780, 795, and 807/811 correlating with the G1-S transition.

AB It has long been known that neoplastic cells are characterized by increases in cell motility. Earlier studies from this laboratory indicated that mitotic events were also altered in many tumor and experimentally transformed cells and that this included increases in metaphase duration and a reduction in the duration of cytokinesis. The studies presented in this paper were done to determine whether or not transfection of normal rat embryo fibroblasts by the Ha-T24-ras oncogene could also produce such alterations in mitotic events. The results obtained with the use of time lapse video microscopy indicate that neither the duration of metaphase nor the rate of chromosome movement during anaphase was altered but that the rate of furrow progression during cytokinesis occurred at a significantly more rapid rate. Thus, the cellular alterations induced by transfection with Ha-T24-ras accelerate microfilament-dependent cytokinetic furrowing without significant effects on microtubule-dependent mitotic events. One of several possible mechanisms that could account for these observations involves a down regulation of protein kinase C which has been reported to occur in many neoplastic cells including those transformed by ras. Such a hypothesis could also have broader implications because it may be applicable to the increase in motility and metastatic activity generally observed in transformed cells.
